## Reliable detection and wide range coverage

- > VGA thermal imaging
- > Bullet-style
- > Multiple lens options
- > Intelligent video applications included
- > Power over Ethernet
- > PT Mount model

With superb image quality and a VGA thermal resolution, AXIS Q1932-E and AXIS Q1932-E PT Mount optimize detection performance and perimeter surveillance to meet the most challenging requirements.

The thermal resolution of 640x480 and a range of lenses make it easy to detect and identify people, objects and incidents. Thanks to new image processing algorithms AXIS Q1932-E/Q1932-E PT Mount cameras offer improved image contrast while keeping noise levels low without adding blur and ghost effects.

Since thermal cameras are less sensitive to problems with light conditions and shadows, they can achieve higher accuracy and less false alarms than conventional cameras in most applications. Hence, enhancing the possibility to efficiently use intelligent video applications.

AXIS Q1932-E PT Mount offers the possibility of mounting the camera on a pan/tilt motor to increase installation flexibility.

These bullet-style cameras are outdoor-ready with IP66 rating and they are designed to withstand harsh weather conditions. AXIS Q1932-E and AXIS Q1932-E PT Mount operate in temperatures from -40 °C to 60 °C (-40 °F to 140 °F) using Power over Ethernet (IEEE 802.3af), making the installation easy and cost-effective.

## Wide range coverage for AXIS Q1932-E & AXIS Q1932-E PT Mount

	Focal length	Viewing angle	Human: 1.8 x 0.5 m Critical dimension: 0.75 m		Vehicle: 1.4 x 4.0 m Critical dimension: 2.3 m	
	mm	Horizontal	meters	yards	meters	yards
<b>Detection (1.5 pixels on target)</b> An observer can see an object	10	57°	320	350	990	1083
	19	32°	580	634	1800	1968
	35	18°	1050	1148	3200	3500
	60	10°	1800	1968	5500	6015
<b>Recognition (6 pixels on target)</b> An observer can distinguish an object	10	57°	80	87	250	273
	19	32°	150	164	440	481
	35	18°	260	284	800	875
	60	10°	440	481	1350	1476
<b>Identification (12 pixels on target)</b> An observer can distinguish a specific object	10	57°	40	44	125	136
	19	32°	75	82	220	240
	35	18°	130	142	400	437
	60	10°	220	240	680	744

The ranges are calculated according to Johnson's criteria and vary in different weather conditions.

### Environmental considerations

Johnson's criteria assume ideal conditions. The weather conditions at site will affect the thermal energy emitted from the object and decrease the effective detection range. The detection range in the tables above is based on a temperature difference of 2 °C between the targeted object and the background. However, weather conditions such as rain, snow and fog will attenuate the radiated energy from the object since the heat radiation from the object is scattered when it hits particles in the air. To avoid performance and reliability problems, the camera should always be tested in its intended environment.

The difference in number of pixels between detection, recognition and identification illustrated with a human target.

### Use of intelligent applications

The sensor in a thermal camera reacts to differences in thermal energy. Thus, the sensor is less sensitive to changing light conditions, darkness and other challenging conditions. This makes thermal cameras a perfect platform to combine with intelligent video applications to build more efficient 24/7 surveillance systems. Through our Application Development Partner Program Axis can offer the widest range of third party applications available.

Integrated with intelligent video applications such as video motion detection or tripwire, the camera can automatically trigger an alert to the operator. To maximize performance of the application and safeguard reliable operation 6 pixels across the object is recommended and the surrounding environment always needs to be considered.
