20
 Video card driver update if necessary

25
 Creation of names for cameras and microphones and sensitivity adjustment on motion detections

30
 Verification and Port opening with Client I.T. Department cooperation for DVR Server and Client Software

Some suggestions...

PTZ Smart Cameras

iMotion Security can install PTZ systems which pan, tilt and zoom the camera lens automatically, guided by automated patrols. Be advised: it is our opinion that having several simultaneous view planes is more effective than having just one. Even though PTZ's has the ability to 'patrol', we have to remember that when a camera points to the right, it has no view to the left, and vice-versa. Because of this, we recommend the installation of several fixed cameras for the most vulnerable areas.

PTZ smart camera systems are ideal for monitoring unpopulated areas. These cameras follow and frame moving objects more efficiently giving the observer better shots, yielding more useful visual information. Contact us to learn more about this smart system.

Infrared Cameras

Infrared cameras are used in professional video monitoring situations when it is necessary to insure continual surveillance, even in pitch darkness. They are commonly called "Day/Night" cameras.

Unlike most cameras, they include infrared transmitters that guarantee a discernable image, even in unlit areas. With sufficient light, the camera's CCD sensor generates colour pictures. With insufficient light, the camera reverts back to black and white.

Multi-site Management

Managing and monitoring several DVR units has never been easier. Our powerful multi-site management software allows you to use all of the features of your DVR digital recorders. Users can now control several DVR units from a single computer.

Thanks to this software, you will gain total control. Our software is an essential tool: it imports site plans, manages direct video, manages alarms, exports registered video and manages users

Cameras with WDR technology

WDR (Wide Dynamic Range) is a dynamic broadband technology that alternates between two shutter speeds, fast and regular, in the same video field. This function captures every detail exactly, even if one part of the frame is bright while other sections are dark. Because of this the combined fields yield high quality images. Below, you can compare different camera technologies with standard exposure compensation, compensation for shots against daylight, and last, with wide dynamic range.
