

## Television broadcasting and sound systems

iMotion security can manage the networking of various electrical and electronic equipment in your premises, overseen by a centralized "intelligence". The intelligence that manages those commands is a central programmable embedded module (home gateway), or a micro-computer interface. The management tools may include a handheld computer, mobile phone, remote control (universal or not), TV screen interface, screen and mouse, touch screen, to name just the major ones.

With such a system, it is possible to use or drive different media simultaneously and at any location in your establishment: music, sound, image, video.

The system can easily send music throughout your premises directly from a phone, stereo system or even a PC. It is possible to create multiple diffusion "zones" - that you can modify at will.

The built-in images diffusion system allows you to connect any video sources (DVD, satellite receiver, decoder, PC, multimedia library, intercom, camera ...) and send the output to any receiver restaurant (primary or secondary TV, touch screen, etc...).

The centralized distribution of data allows you, through a network connected to the Internet, to access different information from any media equipment (television screens, mobile phone, etc...).
