

The ISS line of Video Management Solutions: SecurOS.

SecurOS Xpress

SecurOS Xpress is an ideal solution for video recording and management in small to midsize security deployments, and brings the surveillance system into the network. The advanced features of SecurOS Professional, Premium and Enterprise are now available for smaller installations. SecurOS Xpress shares the same core system and graphical user interface as those three solutions, and can be easily upgraded to either one for future expansions. SecurOS Xpress supports a single server installation, up to 64 cameras.

SecurOS Professional

SecurOS Professional is an excellent solution for standalone or multi-server, medium to large video surveillance deployments up to 320 cameras. It has more advanced features than SecurOS Xpress, and shares the same core system and GUI as SecurOS Premium and Enterprise. Professional supports Point of Sale (POS) and ATM integration and can be deployed standalone or as part of a larger SecurOS Monitoring and Control Center (MCC) system.

SecurOS Premium

SecurOS Premium is an excellent choice for video surveillance applications that require advanced video analytics on specific camera locations and installations. It supports up to 640 cameras and up to 20 channels of analytics. Premium supports the basic complement of ISS Video Analytics Modules and can be deployed standalone or as part of a larger SecurOS Monitoring and Control Center (MCC) system.

SecurOS Enterprise

The global standard for video management and video analytics, the ISS flagship video management software, SecurOS Enterprise is the nucleus of a complete surveillance and security management topology. The framework can manage and monitor an unlimited number of cameras (analog or IP) and devices, apply intelligent video analytics, and integrate a variety of disparate systems into one centralized command and control interface. The SecurOS platform is suited for large mission critical applications that involve hundreds or thousands of cameras, sensors and control systems unified into one network.
