

XProtect® Expert

VMS: Video Management Software

XProtect Expert is an advanced open platform IP VMS for medium and large installations. Its powerful central management helps simplify the installation and daily operation of larger systems with multiple recording servers. XProtect Expert offers reliable video access through failover recording servers and uninterrupted video recording when complemented with camera-associated edge storage. Using scheduled and event-driven rules, it is easy to automate security actions and control external systems, reducing the amount of manual tasks.

Top 5 features

Centralized management

High performance
64-bit recording
server software

Failover recording server support

Supports an unlimited number of sites and servers

Security task automation

For organizations requiring uninterrupted video surveillance

Why XProtect Expert?

XProtect Expert is the ideal solution if an organization requires high-availability, uninterrupted video recording or is looking to automate security tasks.

XProtect Expert benefits

Manage large systems with ease

XProtect Expert's management interface enables administrators to install and configure all devices, servers and user rights for the entire installation, even when deployed across multiple locations.

Create a more efficient security organization

Administrators can use XProtect Expert's rule engine to automate

camera controls, system behavior, lighting and access points.

Assess situations in real-time

XProtect Expert includes interactive maps that provide an overview of your entire installation, including camera locations. You can quickly identify incident locations and visually verify alarms to ensure a rapid and appropriate response to on-going situations. During investigations, you can flag video sequences and add related comments, so you can easily share information with other users.

Ensure continuous video recording

XProtect Expert supports both hot-standby and cold-standby failover

recording servers. This provides continued access to live, uninterrupted recorded video in the event of a server failure. Organizations can supplement this with camera-based edge storage for 100% uninterrupted video recording.

Optimize system performance

Built-in system monitoring tools give administrators a real-time overview of system performance, instant notifications on potential server problems and predictive video retention warnings.

Designed for high performance video recording

Get the most out of your hardware investment:

Run more cameras on less hardware with the high performance recording server software that supports a 4.4 Gbit/s continuous recording rate per server.

Optimize system and network resources:

Multi-live streaming lets operators select the live streams that best fit the viewing purpose, resulting in better viewing performance while reducing system load and network usage.
